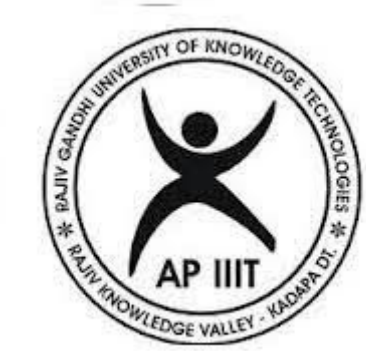
“DIABETES PREDECTIVE SYSTEM”

BACHELOR OF TECHNOLOGY

in

COMPUTER SCIENCE AND ENGINEERING



RGUKT

Rajiv Gandhi University of Knowledge Technologies

R.K.VALLEY

Submitted by

B.Malli Karjuna – R161683

B.Chakrapani-R161037

Sk.Usman-R161081

Under the Esteemed guidance of

Mr. A.MAHENDRA.

RGUKT RK Valley.

DECLARATION

We hereby declare that the report of the B.Tech Minor Project Work entitled "**DIABETES PREDECTIVE SYSTEM**" which is being submitted to Rajiv Gandhi University of Knowledge Technologies, RK Valley, in partial fulfillment of the requirements for the award of Degree of Bachelor of Technology in Computer Science and Engineering, is a bonafide report of the work carried out by us. The material contained in this report has not been submitted to any university or institution for award of any degree.

B.Mallikarjuna – R161683
B.Chakrapani – R161037

INDEX

Abstract

The diabetes is one of lethal diseases in the world. It is additional a inventor of various varieties of disorders foe example: coronary failure, blindness, urinary organ diseases etc. In such case the patient is required to visit a diagnostic center, to get their reports after consultation. Due to every time they have to invest their time and currency. But with the growth of Machine Learning methods we have got the flexibility to search out an answer to the current issue, we have got advanced system mistreatment information processing that has the ability to forecast whether the patient has polygenic illness or not. Furthermore, forecasting the sickness initially ends up in providing the patients before it begins vital. Information withdrawal has the flexibility to remove unseen data from a large quantity of diabetes associated information. The aim of this analysis is to develop a system which might predict the diabetic risk level of a patient with a better accuracy. Model development is based on categorization methods as KNeighbors and SVM algorithms. For KNeighbors, the models give precisions of 79%, 77% for Support Vector Machine. Outcomes show a significant accuracy of the methods.

INTRODUCTION

Diabetes is a situation which causes deficiency due to less amount of insulin in the blood. Warning sign of high blood sugar results in frequent urination, feeling thirsty, increased hunger. If it is not medicated, it will lead to many difficulties. This difficulty lead to death. When there is a rise within the sugar level within the blood, it is referred to as prior diabetes. The effectiveness of the decision support system is recognized by its accuracy. Therefore, the objective is to build a decision support system to predict and diagnose a certain disease with extreme amount of precision. The AI consist of ML which is its subfield that resolves the real world difficulties by "providing learning capability to workstation without supplementary program writing.

MOTIVATION

There has been drastic increase in rate of people suffering from diabetes since a decade. Current human lifestyle is the main reason behind growth in diabetes. In current medical diagnosis method, there can be three different types of errors-

1. The false-negative type in which a patient in reality is already a diabetic patient but test results tell that the person is not having diabetes.

2. The false-positive type. In this type, patient in reality is not a diabetic patient but test reports say that he/she is a diabetic patient.

3. The third type is unclassifiable type in which a system cannot diagnose a given case. This happens due to insufficient knowledge extraction from past data, a given patient may get predicted in an unclassified type.

However, in reality, the patient must predict either to be in diabetic category or non-diabetic category. Such errors in diagnosis may lead to unnecessary treatments or no treatments at all when required. In order to avoid or reduce severity of such impact, there is a need to create a system using machine learning algorithm and data mining techniques which will provide accurate results and reduce human efforts.

PRAPOSED SYSTEM

1.Data Collection

Before collecting the data.we need to import all the libraries which are we going to use in this model

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
from sklearn.preprocessing import StandardScaler
from sklearn.model_selection import train_test_split
from sklearn import svm #support vector machine
from sklearn.metrics import accuracy_score
import seaborn as sns
```

Then we collect the data.we already download the data from Kaggle data set.

We load that data into our system using pandas.

data collection

```
diabetes_dataset=pd.read_csv("diabetes.csv")
diabetes_dataset["Outcome"].value_counts()
diabetes_dataset.head(1000)
```

	Pregnancies	Glucose	BloodPressure	SkinThickness	Insulin	BMI	DiabetesPedigreeFunction	Age	Outcome
0	6	148	72	35	0	33.6	0.627	50	1
1	1	85	66	29	0	26.6	0.351	31	0
2	8	183	64	0	0	23.3	0.672	32	1
3	1	89	66	23	94	28.1	0.167	21	0
4	0	137	40	35	168	43.1	2.288	33	1
...	...	...	...	...	...	...	...	...	...
763	10	101	76	48	180	32.9	0.171	63	0
764	2	122	70	27	0	36.8	0.340	27	0
765	5	121	72	23	112	26.2	0.245	30	0
766	1	126	60	0	0	30.1	0.349	47	1
767	1	93	70	31	0	30.4	0.315	23	0

768 rows × 9 columns

2.Data Preprocessing

This phase of model handles inconsistent data in order to get more accurate and precise results. This dataset contains

missing values. So we imputed missing values for few selected attributes like Glucose level, Blood Pressure, Skin

Thickness, BMI and Age because these attributes cannot have values zero. Then we scale the dataset to normalize

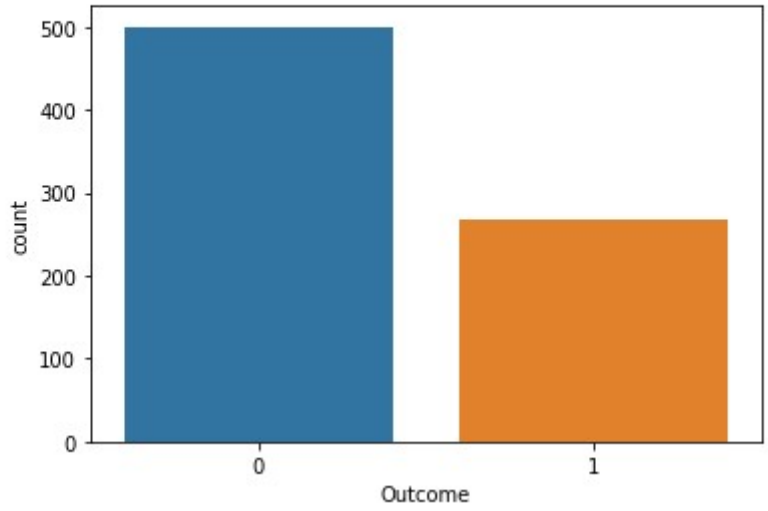
all values.

3.Data analysis

In this step we are going to analyze the data to build a model which predicts whether a person have diabetes or not.

```
sns.countplot(x="Outcome",data=dataset)
```

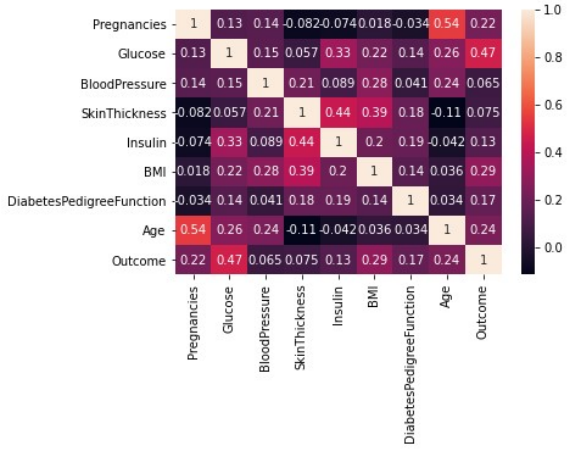
```
Out[1]: <AxesSubplot:xlabel='Outcome', ylabel='count'>
```



It is the plotting of Outcomes coulumn.

Now we plot the correlation Matrix’s Heat map do analyze which factor is most correated to our outcome.

```
In [2]: #correlation matrix
        corr_mat=dataset.corr()
        sns.heatmap(corr_mat, annot=True)
        plt.show()
```



4.Standardizing the data

making lables.

Here we making the lables as x and y axes.In x axis we take all the values except outcome value which is taken on y axis.

X lable values

```
x=dataset.iloc[:,:-1].values
y=dataset.iloc[:,-1].values
x
```

```
array([[  6.   , 148.   ,  72.   , ...,  33.6  ,   0.627,  50.   ],
       [  1.   ,  85.   ,  66.   , ...,  26.6  ,   0.351,  31.   ],
       [  8.   , 183.   ,  64.   , ...,  23.3  ,   0.672,  32.   ],
       ...,
       [  5.   , 121.   ,  72.   , ...,  26.2  ,   0.245,  30.   ],
       [  1.   , 126.   ,  60.   , ...,  30.1  ,   0.349,  47.   ],
       [  1.   ,  93.   ,  70.   , ...,  30.4  ,   0.315,  23.   ]])
```

Y lable values

```
x=dataset.iloc[:,:-1].values
y=dataset.iloc[:,-1].values
y
```

```
array([1, 0, 1, 0, 1, 0, 1, 0, 1, 1, 0, 1, 0, 1, 1, 1, 1, 1, 0, 1, 0, 0,
       1, 1, 1, 1, 1, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 1, 1, 0, 0, 0, 1,
       0, 1, 0, 0, 1, 0, 0, 0, 0, 1, 0, 0, 1, 0, 0, 0, 0, 1, 0, 0, 1, 0,
       1, 0, 0, 0, 1, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0,
       1, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 1,
       1, 1, 0, 0, 1, 1, 1, 0, 0, 0, 1, 0, 0, 0, 1, 1, 0, 0, 1, 1, 1, 1,
       1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0,
       1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 1,
       0, 1, 0, 1, 0, 0, 0, 0, 0, 1, 1, 1, 1, 1, 0, 0, 1, 1, 0, 1, 0, 1,
       1, 1, 0, 0, 0, 0, 0, 0, 1, 1, 0, 1, 0, 0, 0, 1, 1, 1, 1, 1, 0, 1,
       1, 1, 0, 0, 0, 0, 0, 1, 0, 0, 1, 1, 0, 0, 0, 1, 1, 1, 1, 1, 0, 0,
       1, 1, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 0,
       1, 0, 1, 0, 0, 1, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 1, 1, 0,
       0, 1, 0, 0, 0, 1, 1, 1, 0, 0, 1, 0, 1, 0, 1, 1, 0, 1, 0, 0, 1, 0,
       1, 1, 0, 0, 1, 0, 1, 0, 0, 1, 0, 1, 0, 1, 1, 1, 0, 0, 1, 0, 1, 0,
       0, 0, 1, 0, 0, 0, 0, 1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0,
       0, 0, 0, 1, 1, 1, 0, 1, 1, 0, 0, 1, 0, 0, 1, 0, 0, 1, 1, 0, 0, 0,
       0, 1, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1, 1, 1, 0, 0, 1, 0, 0, 1, 0,
       0, 1, 0, 1, 1, 0, 1, 0, 1, 0, 1, 0, 1, 1, 0, 0, 0, 0, 1, 1, 0, 1,
       0, 1, 0, 0, 0, 0, 1, 1, 0, 1, 0, 1, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0,
       1, 0, 0, 1, 1, 1, 0, 0, 1, 0, 0, 1, 0, 0, 0, 1, 0, 0, 1, 0, 0, 0,
       0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 0,
       1, 1, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 0,
       1, 0, 0, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 0,
       0, 0, 0, 0, 0, 0, 0, 1, 0, 0, 0, 1, 1, 1, 1, 0, 0, 1, 1, 0, 0, 0,
       0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0,
       0, 0, 0, 0, 0, 1, 0, 1, 1, 0, 0, 0, 1, 0, 1, 0, 1, 0, 1, 0, 1, 0,
```

splitting the dataset to test and train

```
In [24]: #splitting the dataset to test and train
         from sklearn.model_selection import train_test_split
         x_train,x_test,y_train,y_test=train_test_split(x,y,test_size=0.2,random_state=0)
         x_train.shape
```

```
Out[24]: (614, 8)
```

5.Model Building

from here we are going make a model.

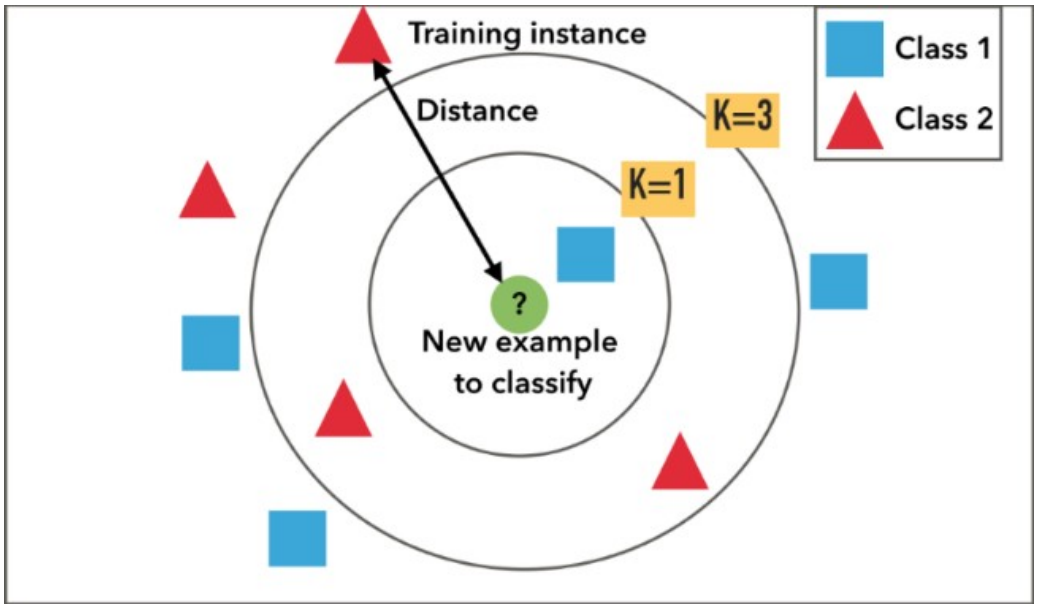
For feature scaling we use standard scaler which predicts the value for new data.

```
: #feature scaling
from sklearn.preprocessing import StandardScaler
sc=StandardScaler()
x_train=sc.fit_transform(x_train)
x_test=sc.transform(x_test)
```

for model we use two classification algorithms

1.Kneighborest Algorithm

KNN works by finding the distances between a query and all the examples in the data, selecting the specified number examples (K) closest to the query, then votes for the most frequent label (in the case of classification)



```
#model building
from sklearn.neighbors import KNeighborsClassifier
knn=KNeighborsClassifier(n_neighbors=25,metric="minkowski")
knn.fit(x_train,y_train)
```

```
KNeighborsClassifier(n_neighbors=25)
```

We have train our data with KNN algorithm with n_neighbors of 25 which was caluculated with least squares.

We Predict the Y values with the Algorithm

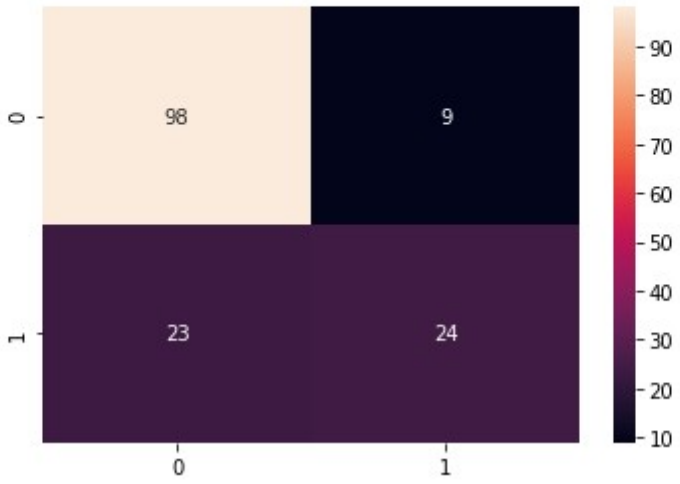
```
In [26]: #prediction
         y_pred=knn.predict(x_test)
         y_pred
```

```
Out[26]: array([1, 0, 0, 1, 0, 0, 1, 1, 0, 0, 0, 1, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0,
                0, 0, 0, 0, 0, 1, 0, 0, 1, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 0, 0, 1,
                1, 0, 0, 0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 0, 0, 1, 1, 0, 1, 1, 1,
                1, 1, 0, 0, 0, 0, 0, 1, 1, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0,
                1, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1,
                0, 0, 0, 0, 1, 1, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, 0, 0,
                0, 1, 0, 0, 0, 0, 1, 0, 0, 1, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0])
```

Confusion Matrix

```
In [16]: #confusion matrix
         from sklearn.metrics import confusion_matrix
         cm=confusion_matrix(y_test,y_pred)
         sns.heatmap(cm,annot=True)
```

```
Out[16]: <AxesSubplot:>
```



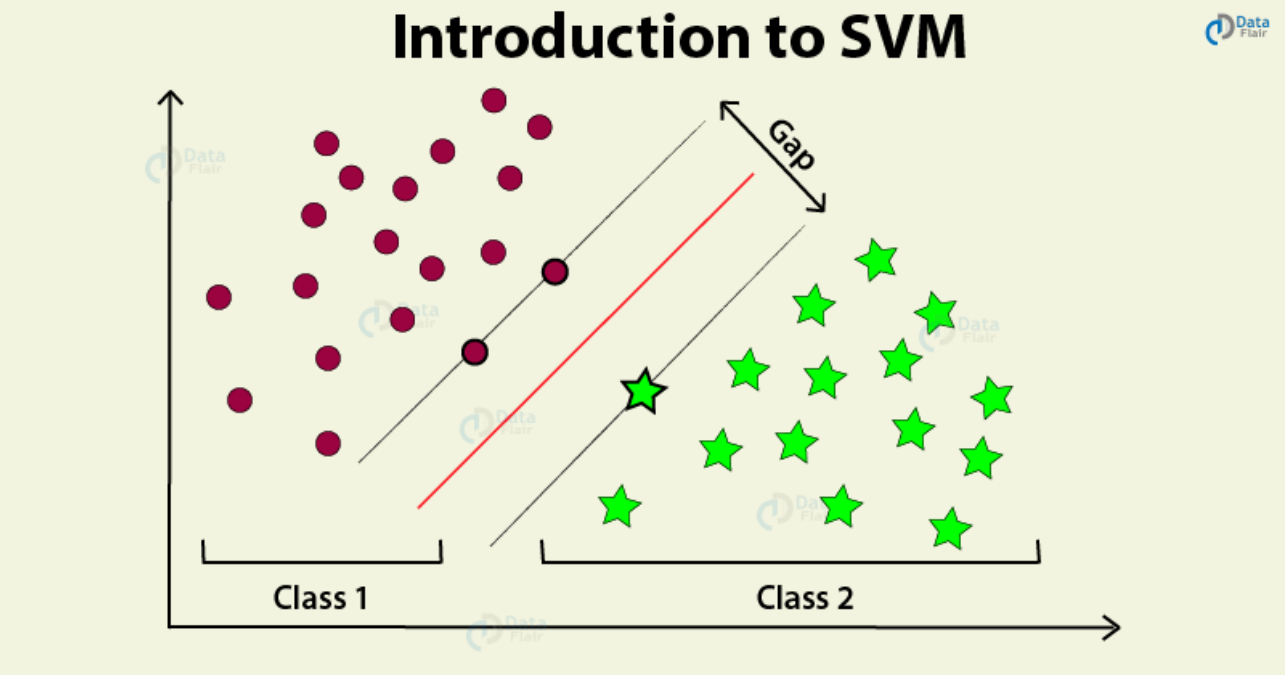
Accuracy with that Algorithm

```
In [17]: #accuracy
         from sklearn.metrics import accuracy_score
         accuracy_score(y_test,y_pred)
```

```
Out[17]: 0.7922077922077922
```

2.Support vector machine algorithm

Support vectors are data points that are closer to the hyperplane and influence the position and orientation of the hyperplane. Using these support vectors, we maximize the margin of the classifier. Deleting the support vectors will change the position of the hyperplane. These are the points that help us build our SVM.



```
#training the model
classifier=svm.SVC(kernel="linear")
```

```
#training the support vector Machine classifier
classifier.fit(X_train,Y_train)
```

```
SVC(kernel='linear')
```

```
#model evaluation
#accuracy score on training data
X_train_prediction=classifier.predict(X_train)
training_data_accuracy=accuracy_score(X_train_prediction,Y_train)
print("accuracy of training data=",training_data_accuracy)
```

```
accuracy of training data= 0.7866449511400652
```

It is the classifier with the algorithm support vector machine which classifies our data and used to predict with our train data.

It gives nearly 0.78 Accuracy score.

6.Making Predective System

In [14]:
```
#making predictive system
input_data=(0,66,9,29,0,26.6,0,31)
input_data_as_numpy_array=np.asarray(input_data)
input_data_reshaped=input_data_as_numpy_array.reshape(1,-1)
#standardized the input data
std_data=scaler.transform(input_data_reshaped)
print(std_data)
prediction=classifier.predict(std_data)
print(prediction)
if(prediction[0]==0):
    print("no diabetics")
else:
    print("yes diabetics")
```

```
[[-1.14185152 -1.71804212 -3.10731749  0.53090156 -0.69289057 -0.68442195
  -1.42512243 -0.19067191]]
[0]
no diabetics
```

Deploying the ML model in Web Appication

after making a predictive system in jupyter notebook.we deploy that system in a web application using Flask.

Before that we load the entire ML model into a pickle file which is useful to deploy entire project with a single file

we load both classifier and standardized data to deploy

]:
```
#saving the classifier model
import pickle
pickle.dump(knn,open("classifier.pkl","wb"))
pickle.dump(sc,open("sc.pkl","wb"))
```

After that we design a simple web page.

Technologies Used

Libraries:

Pandas:

pandas is a software **library** written for the **Python** programming language for data manipulation and analysis. In particular, it offers data structures and operations for manipulating numerical tables and time series.

Sklearn

Scikit-learn is a free machine learning library for Python. It features various algorithms like support vector machine, random forests, and k-neighbours, and it also supports Python numerical and scientific libraries like NumPy and SciPy .

Matplotlib

matplotlib. pyplot is a collection of functions that make matplotlib work like MATLAB. Each pyplot function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

Seaborn

Seaborn is a Python data visualization library based on matplotlib. It provides a high-level interface for drawing attractive and informative statistical graphics. For a brief introduction to the ideas behind the library, you can read the introductory notes.

Pickle

“Pickling” is the process whereby a Python object hierarchy is converted into a byte stream, and “unpickling” is the inverse operation, whereby a byte stream (from a binary file or bytes-like object) is converted back into an object hierarchy.

Framework

Flask:

Flask is a micro web framework written in Python. It is classified as a microframework because it does not require particular tools or libraries. It has no database abstraction layer, form validation, or any other components where pre-existing third-party libraries provide common functions.

Languages

Python

Python offers concise and readable code. While complex algorithms and versatile workflows stand behind machine learning and AI, Python's simplicity allows developers to write reliable systems. ... Python code is understandable by humans, which makes it easier to build models for machine learning.

HTML

The HyperText Markup Language, or HTML is the standard markup language for documents designed to be displayed in a web browser.

CSS

Cascading Style Sheets is a style sheet language used for describing the presentation of a document written in a markup language such as HTML.

JAVASCRIPT

JavaScript is high-level, often just-in-time compiled, and multi-paradigm. It has curly-bracket syntax, dynamic typing, prototype-based object-orientation, and first class functions

Future Scope of the Project

A multicenter study with more variables can give different results. More variables can be included using Delphi Method. The present methodology used i.e. Logistic Regression can be compared with more advance tools like ANN (Artificial Neural Network) for the results.

Conclusion

Diabetes is a heterogeneous group of diseases. It's characterized by chronic elevation of glucose in the blood. The main motto of the American diabetes association [46] is "To prevent and cure diabetes and to improve the lives of all people affected by diabetes". To support the lives of the people all over the world, Support vector machine and NB techniques give the accuracy of 77.73% and 73.48% respectively from the existing method and the proposed method improves the accuracy of the classification techniques. Improved SVM accuracy is 77% and NB accuracy is 82.30%, hence it is able to map the features effectively from low dimensions to high dimensions. It gives the best fit to the data with respect to the diabetic and non-diabetic patients. The Disease prevalence percentage is measured highest from the SVM is 45.7%.
